

HIPORA is a breathable fabric that consists of a three-layer microporous coating structure.

The first layer incorporates pores less than 0.5 μ m in diameter, preventing water penetration and peeling of the coating.

The second layer consists of a honeycomb-like structure. This porous layer achieves moisture permeability and resistance to water penetration.

The third layer has a very thin, dense structure that increases water resistance.

Thanks to these three complex layers, HIPORA provides optimal comfort to you, the consumer.
